

PROJECT DOCUMENTATION

Project Quality Plan

Project:	CoopCart — Wholesale Egg Ordering Platform
Client:	Abeyrathna Farms
Release:	2026
PM Approach:	Agile (Scrum)
Author:	« Your Name » (Quality Manager)
Owner:	« Supervisor / Project Board »
Document Ref:	Project Quality Plan
Version No:	1.0

1. Project Quality Plan History

1.1 Document Location

This document is only valid on the day it was printed. The master copy is stored in the project's shared repository (GitHub / shared drive) under the project management section.

1.2 Revision History

Revision Date	Previous Revision Date	Summary of Changes	Changes Marked
05/08/2026	—	First issue	N/A

1.3 Approvals

This document requires the following approvals. Signed approval forms are filed in the management section of the project files.

Name	Signature	Title	Date of Issue	Version
« Your Name »		Quality Manager	05/08/2026	1.0
« Project Manager »		Project Manager	05/08/2026	1.0
« Supervisor »		Project Board	05/08/2026	1.0
Abeyrathna Farms		Client	05/08/2026	1.0

1.4 Distribution

This document has been distributed to:

Student ID	Student Name	Role	Version
« ID »	« Your Name »	Quality Manager	1.0
« ID »	« Name »	Project Manager	1.0
« ID »	« Name »	Start-up Manager	1.0
« ID »	« Name »	Scheduling Manager	1.0

3. Purpose

The purpose of this Quality Plan is to define the quality standards, the techniques to be applied, and the responsibilities required to achieve those standards throughout the CoopCart project. CoopCart is an online wholesale egg-ordering platform built for Abeyrathna Farms, and this plan ensures the delivered system is correct, secure, usable, and reliable.

4. Customer's Quality Expectations

The client expects the system to provide the following quality attributes:

- 1.A professional, clear, and well-organised wholesale ordering website.
- 2.A mobile-friendly and responsive design.
- 3.Easy navigation for business customers.
- 4.Secure account registration with email OTP (one-time-passcode) verification.
- 5.Accurate AI assistant and report insights that use only approved data.
- 6.Reliable order tracking and live-chat communication.
- 7.Correct bulk-tier pricing and order-total calculations.

5. Acceptance Criteria

Area	Acceptance Criteria
Functionality	Catalogue, registration & approval, ordering, checkout, payments, and the admin console all work correctly.
Testing	Unit testing (Jest) and system testing complete successfully.
Security	Only approved businesses see pricing and can order; only staff roles can access the admin console (RBAC); email is OTP-verified.
Usability	The website is easy to use and navigate on mobile and desktop.
Performance	Pages load within a short time.
Accuracy	Prices and order totals are correct; the AI assistant and insights use only approved, aggregated data.

6. Quality Responsibilities

Role	Responsibility
Project Manager	Ensure project activities follow the defined quality standards.
Quality Manager	Define quality rules, review deliverables, perform unit testing, and maintain the quality log.
Developers	Build the components to specification and fix reported defects.
Client (Abeyrathna Farms)	Review and approve the final system.

7. Applicable Standards

The following standards and best practices are followed during development:

1. Agile software-development methodology (Scrum sprints).
2. Web quality and responsive-design standards.
3. Secure authentication practices (email OTP).
4. Role-based access control (RBAC) security practices.
5. Data-privacy practice — only aggregated data is sent to AI services; no customer personal data leaves the server.

8. Quality Control and Audit Processes

Process	Description
Product Checklists	A checklist is maintained for each deliverable to verify quality standards.
Quality Logs	Used to track defects, bugs, and corrective actions (see the Quality Log).
Unit Testing	Jest tests on business logic — pricing tiers, formatting, delivery dates, RBAC, OTP, and email.
Integration Testing	Ensure the front-end and the Supabase back-end communicate correctly.
Sprint Reviews	Review completed tasks and verify quality compliance each sprint.
System Testing	Test the entire system before deployment.

9. Specialist Work Quality Control

Special attention is given to:

- AI assistant & report insights (must use only approved, aggregated data).
- User authentication (secure OTP login and RBAC).
- Live-chat functionality.
- Payment-slip upload and verification.
- Supabase database connections and queries.

All of the above must be tested before approval.

10. Change Management Procedure

- Changes are approved by the project manager and the client.
- Impact analysis is performed on system functionality and the schedule.
- The system is re-tested for anomalies after changes to ensure quality standards before release.

11. Configuration Management Plan

Configuration management ensures proper control of system versions and project artifacts:

- 1.**Version Control:** a GitHub repository manages all code versions.
- 2.**Documentation Management:** project documents are stored in shared repositories.
- 3.**Backup Strategy:** regular backups are maintained for project files.

12. Quality Tools

Tool	Purpose
GitHub	Version control and team collaboration.
Checklists	Ensure quality standards for each deliverable.
Jest	Unit testing of business-logic modules.
ESLint / TypeScript	Static code-quality and type checks.
Manual & browser testing	UI and end-to-end verification of user journeys.
